BARET

MONAD METROPOLIS · TRUST, IDENTITY & AI INFRASTRUCTURE

CHECK IT FIRST. THEN SIGN.

LIVE ON MONAD TESTNET · CHAIN ID 10143

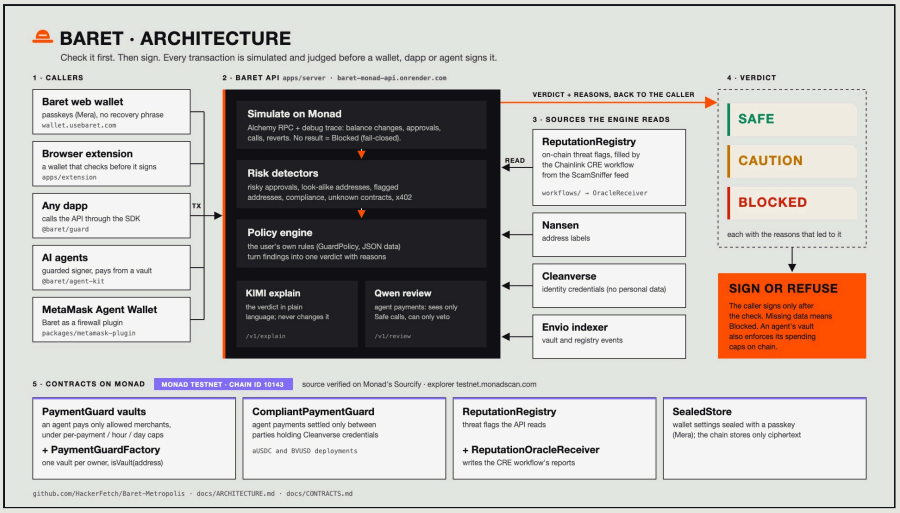

01 THE PROBLEM

People and AI agents sign transactions they cannot read. A wallet shows an address, a function name and hex; the signature behind "enable trading" is an unlimited allowance to a look-alike address. An agent's key signs whatever the model decides, and a prompt injection or a wrong merchant ends in a valid signature on the wrong transaction. On Monad a block is final in under a second, so the check has to come before the signature.

02 THE SOLUTION

Baret is a pre-sign check that wallets, dapps and agents call before they sign: one `POST /v1/analyze` or the `@baret/guard` SDK. It simulates the transaction on Monad, runs nine detectors, applies the signer's own 25-rule policy and answers **SAFE**, **CAUTION** or **BLOCKED**, with reasons. It fails closed. For agents: a PaymentGuard vault with on-chain caps per merchant, payment, hour and day, an owner's kill switch, and a Qwen reviewer that can only veto.

03 HOW IT WORKS

- **Simulate** on Monad with debug_traceCall: every balance change, allowance and contract touched.
- **Detect** with nine detectors, including the on-chain reputation registry, Cleanverse identity and Nansen labels.
- **Decide** with the signer's own policy.
- **Explain** in plain words (KIMI); the model never decides.
- Missing data means **Blocked**.

04 SPONSOR TECHNOLOGY

Chainlink CRE	Feeds ScamSniffer's blacklist into the on-chain ReputationRegistry.
Cleanverse	A-Pass credentials checked before aUSDC moves; enforced in CompliantPaymentGuard.
Envio	HyperIndex indexes every vault, payment and registry change.
Nansen	Profiler trust level for the counterparty, as a detector input.
Mera	The web wallet's account layer: one passkey, no seed phrase.
Dynamic	The demo agent is a Dynamic server wallet paying from a vault.
Alchemy	Batched chain reads for every analysis through its Monad RPC.
KIMI	Explains each verdict in plain words; cannot change it.
Qwen 3.8 Max	Reviews agent payments with read-only tools; can only veto.

05 PROOF

- **Venue**, an independent developer's order book, wired @baret/guard into its signing path; its test found a rule gap we fixed the same day. `github.com/brutaldevvin/venue/commit/cf33716`
- @baret/guard, agent-kit, llm **0.1.3** on npm.
- 1,507 automated tests, 85 Foundry tests; verify:demo 20 of 20 on the live API.
- Contracts source verified on Monad's Sourcify.
- Dynamic agent payment: `testnet.monadscan.com/tx/0x06a81dda28c49041c2bfa4b5c841b350021be408a4745ba5f56c07cc2b124ab3`
- Cleanverse aUSDC settlement: `testnet.monadscan.com/tx/0xd93efca3ee70e3e0fb7ab74a31026eebc99f00f04d7935b10104278915c66293`
