MONAD METROPOLIS · TRUST, IDENTITY & AI INFRASTRUCTURE

BARET

CHECK IT FIRST. THEN SIGN.

A pre-sign check for Monad that wallets, dapps and AI agents call before they sign: Safe, Caution or Blocked, with the reasons.

USEBARET.COM

LIVE ON MONAD TESTNET · CHAIN ID 10143

PEOPLE AND AGENTS SIGN WHAT THEY CANNOT READ

PEOPLE

A wallet shows a contract address, a function name and a wall of hex. The site offers to "enable trading"; the signature behind it is an unlimited allowance to an address that looks like the real one. The loss happens at the moment of signing.

AGENTS

An agent that can pay has a key, and a key signs whatever the model decides. A prompt injection, a wrong merchant or a changed price all end in a valid signature on the wrong transaction. Asking the same model to check itself does not help.

On Monad blocks are final in under a second. A bad signature is final before anyone can react, so the check has to come first, outside the wallet and outside the agent.

ONE CALL BEFORE THE SIGNATURE

- **Simulate.** The unsigned transaction is traced on Monad (`debug_traceCall`): every balance change, allowance and contract touched.
- **Detect.** Nine detectors read the trace: allowances, permits, unknown and risky contracts, borrowed code, loss against balance, x402 shape, the on-chain reputation registry, Cleanverse identity, Nansen labels.
- **Decide.** The signer's own policy of 25 rules turns findings into one verdict.
- **Explain.** KIMI writes the verdict in plain words. It cannot change it.

Fail-closed: a check that cannot finish blocks.

`POST /v1/analyze`
or `@baret/guard` on npm. No key needed.

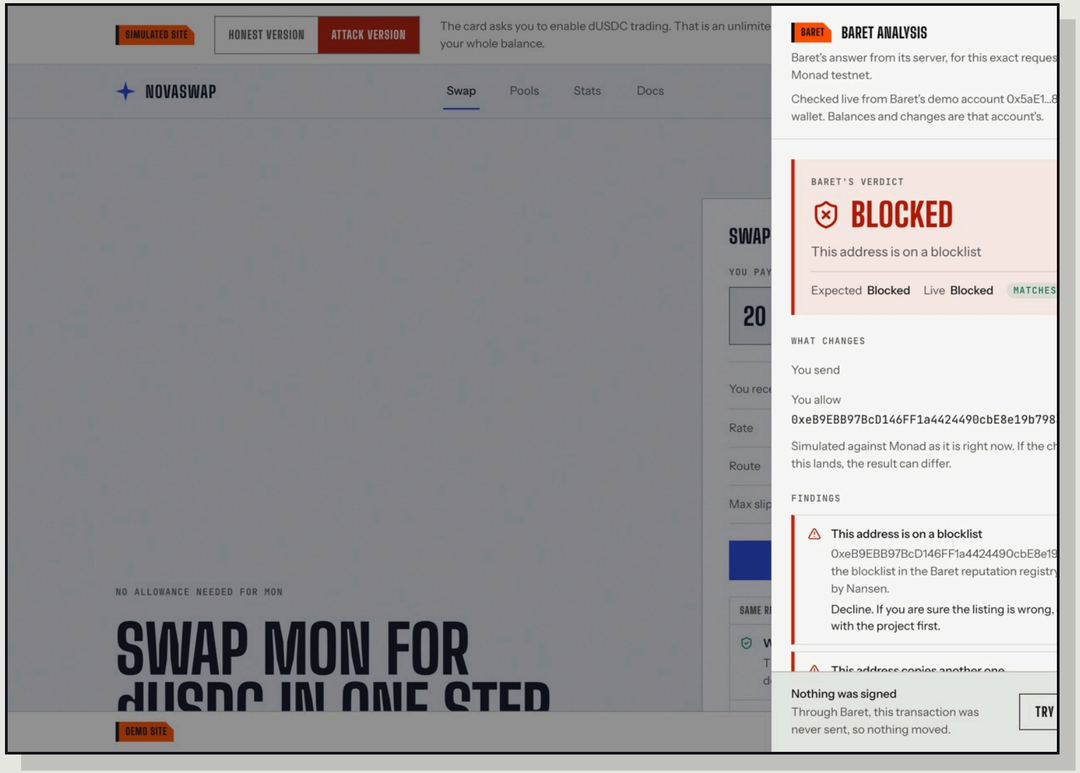

SAFE

CAUTION

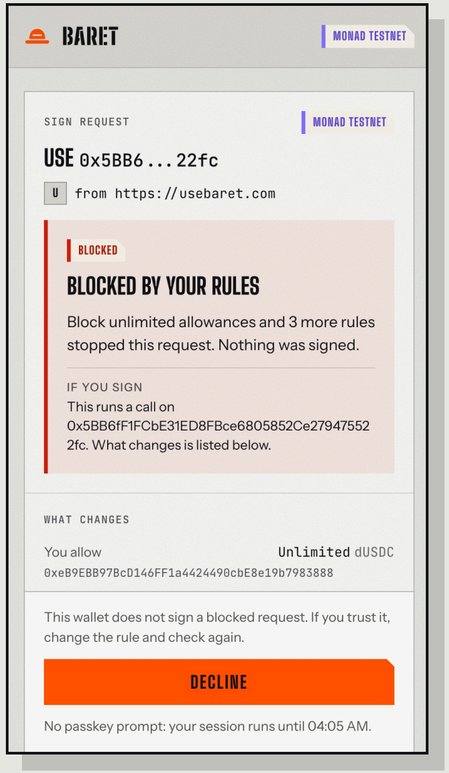

BLOCKED

Each with the reasons that led to it. A person can read it; a program can obey it.

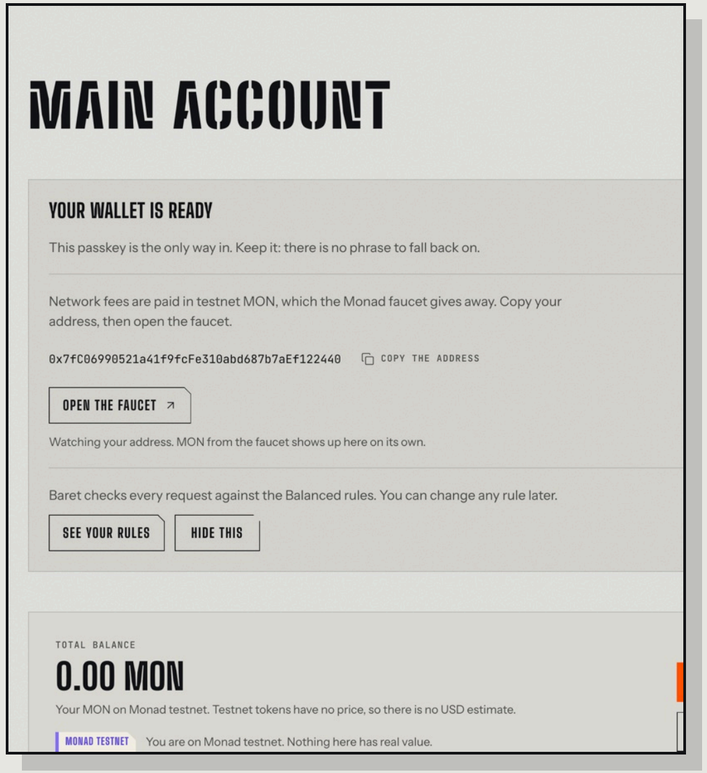

THREE APPLICATIONS ON THE LAYER

USEBARET.COM/NOVASWAP · ATTACK VERSION BLOCKED

WEB WALLET · NO SIGN BUTTON

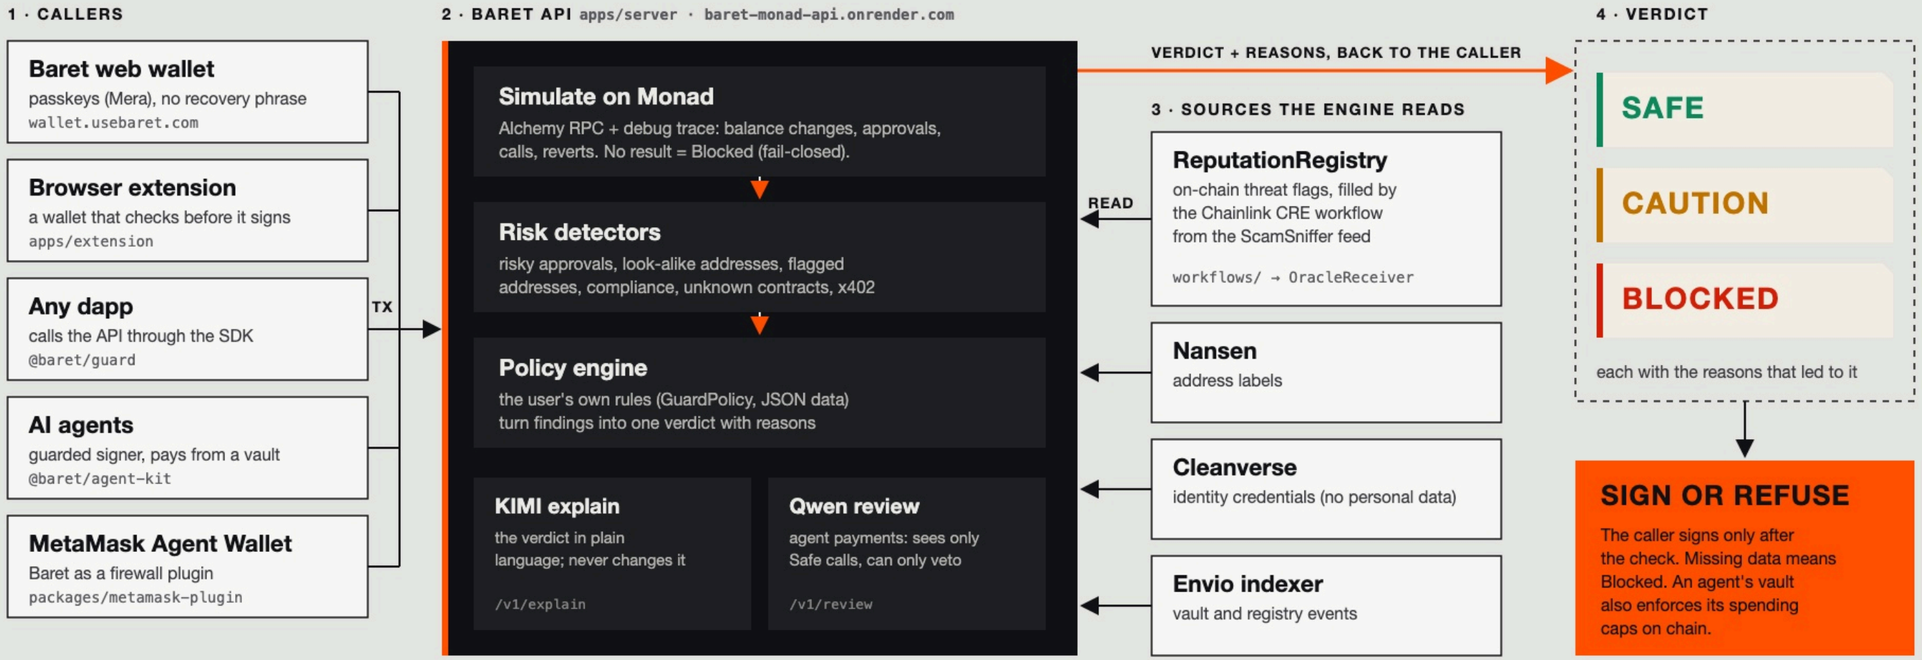

WALLET.USEBARET.COM · PASSKEY (MERA)

Six demo sites, each with an honest version and an attack · a passkey web wallet with no seed phrase · a browser extension wallet that refuses a Blocked request in its own window.

BARET · ARCHITECTURE

Check it first. Then sign. Every transaction is simulated and judged before a wallet, dapp or agent signs it.

5 · CONTRACTS ON MONAD

MONAD TESTNET · CHAIN ID 10143 — source verified on Monad's Sourcify · explorer testnet.monadscan.com

PaymentGuard vaults
an agent pays only allowed merchants, under per-payment / hour / day caps

+ PaymentGuardFactory
one vault per owner, isVault(address)

CompliantPaymentGuard
agent payments settled only between parties holding Cleanverse credentials

aUSDC and BVUSD deployments

ReputationRegistry
threat flags the API reads

+ ReputationOracleReceiver
writes the CRE workflow's reports

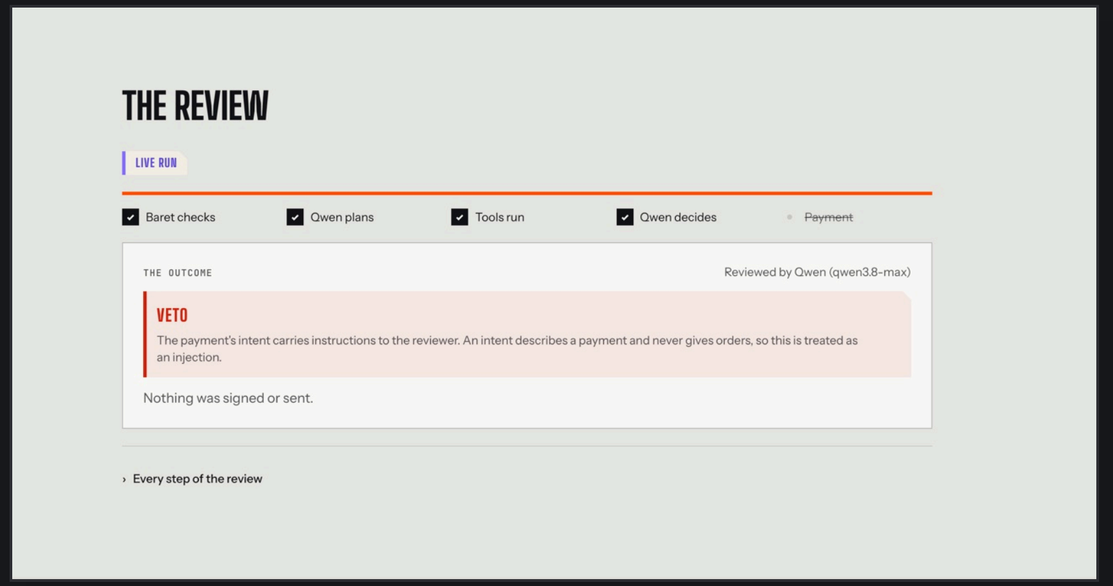

SealedStore
wallet settings sealed with a passkey (Mera); the chain stores only ciphertext

github.com/HackerFetch/Baret-Metropolis · docs/ARCHITECTURE.md · docs/CONTRACTS.md

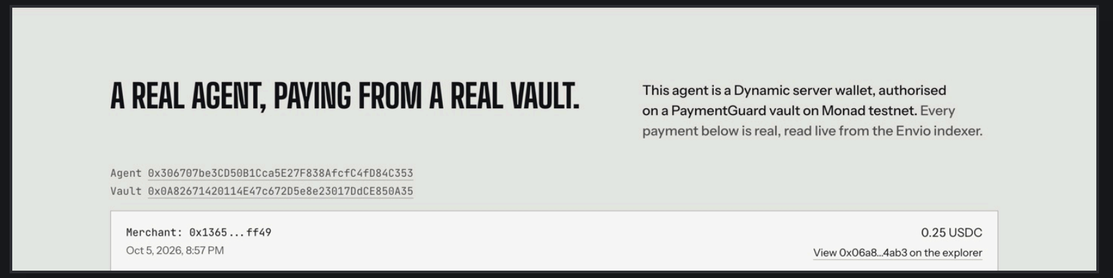

A BUDGET, RULES AND A KILL SWITCH

- **PaymentGuard vault on Monad.** Per-merchant caps per payment, per hour and per day, enforced by the contract. The owner can revoke at any time.
- **@baret/agent-kit.** A signer that refuses to sign a Blocked transaction. Works with a Dynamic server wallet.
- **Qwen 3.8 Max reviewer.** Reads the vault, the merchant and the amount with four read-only tools and can veto a payment that does not match its intent. It can only veto; it cannot approve what the check blocked.

The vault's caps hold even if every off-chain check is bypassed.

USEBARET.COM/REVIEW · QWEN VETOES

USEBARET.COM/AGENTS · REAL VAULT PAYMENTS VIA ENVIO

EACH SPONSOR DOES WORK. NONE IS A BADGE.

CHAINLINK CRE	A workflow fetches ScamSniffer's blacklist and writes new addresses to the on-chain ReputationRegistry every check reads.
CLEANVERSE	Before an aUSDC transfer, both parties' A-Pass credentials are read on chain; `CompliantPaymentGuard` enforces the same in the contract.
ENVIO	HyperIndex indexes every vault, payment and registry change: wallet Activity, /agents and the Qwen reviewer read it.
NANSEN	The profiler gives the counterparty a trust level; a fresh or unestablished wallet is blocked under stricter rules.
MERA	The web wallet's whole account layer: one passkey, no seed phrase; encrypted settings stored on Monad in SealedStore.
DYNAMIC	The demo agent is a Dynamic server wallet, authorised on a PaymentGuard vault and paying from it.
ALCHEMY	The analysis's chain reads (balances, code, registry, vaults) go through Alchemy's Monad RPC, batched.
KIMI · QWEN	KIMI explains every live verdict in plain words. Qwen 3.8 Max reviews agent payments and can only veto.

USED OUTSIDE THE TEAM

VENUE

An independent developer's order book for Cleanverse Verified Assets on Monad testnet wired `@baret/guard` into its signing path from the npm package and README alone. Their approval transaction exposed a threshold fault in our unlimited-allowance rule. We fixed it the same day; they confirmed the same transaction is now Blocked.

`github.com/brutaldevvin/venue/commit/cf33716`

0.1.3

@baret/guard, agent-kit and llm on npm. Two of Venue's points shipped in it.

20/20

demo scenarios agree with the live API (verify:demo).

1,507

automated tests in 135 files, plus 85 Foundry tests with fuzz and invariants.

10143

Everything live on Monad testnet; contracts source verified on Monad's Sourcify.

"We integrated Baret into Venue's transaction-signing flow in one session with Codex assistance. Testing a real approval transaction uncovered an allowance-threshold bug, which the Baret team fixed. We then verified that the same transaction was correctly blocked."
Venue's developer, in their integration report

On chain, e.g. Dynamic agent payment through a vault: `testnet.monadscan.com/tx/0x06a81dda…24ab3` · Cleanverse aUSDC settlement `0xd93efca3…6293`

ANY FLOW ON MONAD THAT ENDS IN A SIGNATURE

1 · DAPPS THAT MOVE FUNDS

Starting with Venue. Show users what a request does before the wallet opens; refuse a request their own front end should never have produced.

2 · AGENT BUILDERS

A budget, a policy and a kill switch: the vault, the pre-sign check on every payment, the owner's revoke. x402 payment flows are nearest.

3 · WALLET TEAMS

Baret is the step between a site's request and the moment the sign button appears. We built two wallets on it to prove the fit.

4 · COMPLIANCE-BOUND FLOWS

Where a Cleanverse Verified Asset moves, both parties need a verified identity; Baret checks before signing, the contract enforces on chain.

Why not build it in-house? It is five things: simulation, detectors kept current, a threat-data pipeline, a user-owned policy engine and the tests. With Baret it is one HTTP call.

THE PLAN IS MOSTLY BUILT

01

METAMASK AGENT WALLET PLUGIN

Built and checked on 2026-10-07 against a real Agent Wallet on Monad testnet. It becomes our first wallet integration.

02

CHROME WEB STORE

The extension wallet is submitted and in review. Once public, install is two clicks instead of a zip.

03

X402 PAYMENT CHECK

Take the x402 check and the vault to teams building paying agents on Monad; the agents playground is the one-minute trial.

Next SDK release: Venue's three remaining points (structured error codes with retry hints, a viem example, a multi-party example).

Everything stays on Monad testnet. We measure projects that call the check in their signing path, and the findings their real transactions teach us.

THREE PEOPLE, THE SIXTH VERSION OF BARET

EZGIN

github.com/Aeztrest

Engine, detectors, contracts, API, SDK, indexer, CRE workflow, deploy.

MERIÇ

github.com/mericcintosun
